

ISBT WORKING PARTY ON QUALITY MANAGEMENT (WP-QM)

QUALITY INDICATORS FOR BLOOD ESTABLISHMENTS AND HOSPITAL BLOOD BANKS – REVISION 2023

Prepared by: Tomislav Vuk (Croatia)

<u>Expert review team</u>: Christian Seidl (Germany), Lesley Bust (South Africa), Yan Qiu (China), Nigar Ertuğrul Örüç (Türkiye)

Quality Indicators are objective quality measures of key system elements, used to identify potential quality concerns and risks, and to monitor the changes over time. In 2012, the ISBT Working Party on Quality Management proposed and published a set of quality indicators to assist blood establishments in selection and implementation of quality indicators [1,2,3]. This document has undergone several revisions so far. The current version is supplemented with information on the importance of each quality indicator and the source data required for their calculation.

This document covers the activities of blood establishments (BE), which are collection, testing, processing, storage, release and distribution of human blood or blood components (including source plasma) when intended for transfusion or further industrial manufacturing, as well as activities of hospital blood banks (HBB), mainly related to storage, issue, compatibility tests, and hospital-based transfusion activities. However, in some hospital-based blood services HBB may additionally be engaged in blood collection, processing, and donation testing activities, and thereby function as blood establishments [4].

Quality indicators are usually expressed as a relative frequency, most commonly as a percentage. To calculate relative frequency, the numerator (observations of interest) and the denominator (total number of observations) should be defined, as demonstrated in this document. Quality indicators can also be expressed on the Six Sigma scale.

Contents

The quality indicators proposed in this document are categorized in the following groups:

- Blood donor recruitment, selection and counseling
- Blood/blood component collection
- Blood component preparation
- Donor/blood component testing
- Blood component storage/distribution/issue
- Patient service
- Quality management

BLOOD DONOR REC	RUITMENT, SELECTION AND COUNSELING
Quality indicator	Implementation of the whole blood collection plan
Description	Percentage of whole blood donations collected, relative to the planned
Importance	This indicator is a measure of success in promoting blood donation and
	collecting the planned number of whole blood donations, with the aim of
	supplying hospitals with adequate amounts of blood components.
Numerator	Number of whole blood donations collected.
Denominator	Planned number of whole blood donations.
Quality indicator	Implementation of the plan for collecting blood components by apheresis
Description	Percentage of apheresis donations collected, relative to the planned number.
	This indicator should be used separately for specific component types (blood
	components for clinical use, source plasma).
Importance	This indicator shows the extent to which the apheresis program can meet the
	needs for blood components obtained by this technology.
Numerator	Number of apheresis donations collected (according to the blood component type).
Denominator	Planned number of apheresis donations (according to the blood component
	type).
Quality indicator	Donations collected from first-time donors
Description	Percentage of donations collected from first-time donors, relative to the total
	number of donations.
Importance	This indicator shows the extent to which blood establishment is successful in
	promoting blood/blood component donation. Continuous recruitment of new
	donors into the donation system is a guarantee of a sustainable blood
	component supply.
Numerator	apheresis).
Denominator	Number of whole blood and/or apheresis donations.
Quality indicator	Donor deferral rate – total
Description	The percentage of blood donors temporarily and permanently deferred from
	donating whole blood and blood components using apheresis procedure. This
	indicator can be used separately for whole blood donations and for apheresis
	donations.
Importance	This indicator monitors the trend of donor deferrals over time. Deviations from
	the predicted frequency may indicate the need for further investigation to verify
	if deferral criteria are consistently and uniformly applied or if such a deviation
	indicates an emerging situation. Depending on the results obtained, a more
	detailed analysis of individual deterral reasons may be indicated. This indicator
	and (or opidemiological variations affecting dopor deformals
Numerator	All depart deformates from departing whole blood and/or blood components using
Numerator	anheresis procedure, regardless of the deferral reasons
Denominator	Number of whole blood and/or apperesis donor attendances
	Donor deferral rate – temporary
Description	The percentage of blood donors temporarily deferred from donating whole
Description	blood and blood components using apheresis procedure. This indicator can be
	used separately for whole blood donations and for apheresis donations.
Importance	This indicator monitors the trend of temporary donor deferrals over time.
	Deviations from the predicted frequency may indicate the need for the
	investigation to verify if deferral criteria are consistency and uniformly applied

	or if such a deviation indicates an emerging situation. Depending on the results obtained, more detailed analysis of individual deferral reasons may be indicated. This indicator is also important in planning blood donation sessions considering seasonal and/or epidemiological variations affecting donor deferrals.
Numerator	Number of temporary deferrals of blood donors from donating whole blood and/or blood components using apheresis procedure, regardless of the deferral reasons.
Denominator	Number of whole blood and/or apheresis donor attendances.
Quality indicator	Donor deferral rate – permanent
Description	The percentage of blood donors permanently deferred from donating blood or
	blood components. This indicator can be used separately for whole blood donations and for apheresis donations.
Importance	This indicator monitors the frequency of permanently deferred donors over
	time. Deviations from the predicted frequency may indicate the need for the
	investigation to verify if deferral criteria are consistently and uniformly applied,
	or a modification of the criteria is required.
Numerator	Number of permanently deferred donors (all donors permanently deferred from
	donating whole blood and/or blood components using apheresis procedure,
	regardless of the reasons for deferral).
Denominator	Number of whole blood and/or apheresis donor attendances.
Quality indicator	Donor deferral due to low hemoglobin concentration
Description	donating blood and/or blood components, due to low hemoglobin concentration. This indicator can be used separately for whole blood donations and for apheresis donations.
Importance	This indicator monitors the trend of donor deferrals due to low hemoglobin
	concentration, the most common cause of blood donor temporary deferral.
	Deviations from the predicted frequency may indicate seasonal variations,
	accuracy of the methods used for hemoglobin determination, skills of the blood
	establishment staff, the success of strategies aimed at reducing iron loss in
	donors, etc.
Numerator	Deferred donors (all donor deferrals from donating whole blood and/or blood
Deneminator	Components using apheresis procedure, due to low nemoglobin concentration).
Denominator Quality indicator	Post denotion information (DDI)
	Post-donation information (PDI)
Importance	PDI reflects the chartcomings, limitations, and complexity of the deper selection
importance	process Knowledge of the causes of PDL events their types and frequency is a
	prerequisite not only for their effective management but also for the
	implementation of measures to improve the selection process and the safety of
	donated blood.
Numerator	Number of donations of suspected quality/safety due to reported PDI.
Denominator	Number of donations collected (whole blood and apheresis donations).
Quality indicator	Lipemic donations
Description	Percentage of donations where the entire donation or any of the related blood
	components (most often plasma) was discarded due to the lipemia.
Importance	Lipemic donations reduce supply of blood component for direct clinical use
	and for fractionation. Donor education on dietary habits prior to blood/plasma
	donation is very important, not only for improving the quality of blood
	components but also for donor health status.

Numerator	Number of donations where the entire donation or any of the related blood
	components (most often plasma) was discarded due to the lipemia (whole blood
	and apheresis donations).
Denominator	Total number of donations: from whole blood and obtained by anheresis
	MPONENT COLLECTION
Quality indicator	
Description	Percentage of failed collections. Separate data on whole blood and anheresis
Description	donations is more informative.
Importance	Blood collection is one of the key processes in the transfusion chain affecting
	both donor satisfaction and blood component quality and safety. Collection
	failures represent one of the leading nonconformities in blood establishments.
	Apart from being a negative motivating factor for blood donors, they also affect
	the blood components supply and have a negative financial impact.
Numerator	Failed collections:
	1. Venipuncture failures in the narrow sense (failure to introduce the
	needle into the donor's vein): no blood is collected at all.
	Interrupted blood collection due to:
	a. slow (inadequate) flow
	b. hematoma
	c. donor adverse reaction
	d. other (technical factors).
Denominator	Total number of donations (whole blood and/or apheresis, commenced
	collections).
Quality indicator	Clots in red blood cell (RBC) components
Description	Percentage of red blood cell components (whole blood, red cell concentrates,
	buffy coats) with clots, relative to the total number of whole blood donations
	(complete donations).
Importance	This is an important indicator for assessing the quality of blood collection
	process. Slow or intermittent blood flow during donation may induce clot
	formation and often depends on the vein selection and the position of the
	needle in the vein. This indicator is also used to assess the efficiency of blood
	mixing with anticoagulant solution on blood collection. At institutions
	employing manual mixing it is an indicator of correct staff technique and in case
	of automated scales/mixers this indicator points to the correct device operation.
Numerator	Number of RBC components with clots.
Denominator	Number of whole blood donations (complete collections).
Quality indicator	Aggregates in platelet (PLT) concentrates obtained by apheresis
Description	Percentage of PLT concentrates obtained by apheresis discarded due to the
	presence of aggregates (persistent aggregates after the mandatory rest period
	and throughout the storage).
Importance	This indicator points to the factors contributing to the formation of aggregates
	(apheresis procedure, donor related factors, storage conditions).
Numerator	Number of apheresis PLT concentrates discarded due to the presence of
	aggregates.
Denominator	Total number of PLT concentrates obtained by apheresis (complete collections).
Quality indicator	Aggregates in PLT concentrates obtained from whole blood
Description	Percentage of PLT concentrates obtained from whole blood, discarded due to
	the presence of aggregates (persistent aggregates after the mandatory rest
	period and throughout the storage).
Importance	This indicator points to the factors contributing to the formation of aggregates
	in whole blood-derived PLT concentrates (collection systems, temperature

	during collection and storage of whole blood, preparation method, storage conditions).
Numerator	Number of whole-blood-derived PLT concentrates discarded due to the
	presence of aggregates.
Denominator	Total number of PLT concentrates produced from whole blood.
Quality indicator	Poor welds in blood collection
Description	Percentage of donations found to be nonconforming due to the poor weld.
Importance	This indicator largely points to the process ability to meet the requirements of
	microbiological safety of blood components by maintaining the weld integrity.
	Its monitoring enables timely service or repair/renewal of the sterile welding
	devices, or indicates inappropriate quality, handling, or maintenance of these
NI	devices.
Numerator	Blood components with poor welds (no matter how they were detected: during
Donominator	Total number of blood denations (whole blood + apparesis denation
Denominator	commenced collections)
Quality indicator	Inadequate volume of whole blood collected
Description	Percentage of underweight or overweight whole blood collections (completed
	donations).
Importance	In overweight blood donations, the amount of anticoagulant is not sufficient to
	prevent blood clotting while in underweight units there is an excess of
	anticoagulant and compromised quality of blood components.
Numerator	Number of underweight or overweight whole blood collections. Failed
	collections where donation process has been interrupted should not be
Deneminator	calculated.
Quality indicator	Donor adverse reactions (complications
Quality indicator	Donor adverse reactions/complications expressed as a percentage
Quality indicator Description Importance	Donor adverse reactions/complications Incidence of donor adverse reactions/complications expressed as a percentage. For most people, donating blood and blood components is a safe and well-
Quality indicator Description Importance	Donor adverse reactions/complications Incidence of donor adverse reactions/complications expressed as a percentage. TPREPARATION Nonconforming blood components Percentage of nonconforming blood components relative to the total number of blood components produced. This indicator includes all types of blood components discarded due to the various reasons. The primary role of blood establishments is to ensure adequate supplies of quality and safe blood components, with minimal waste of this valuable resource. The achievement of this goal is assessed by monitoring various indicators. Reducing the number of nonconforming blood components can be achieved by modifying and optimizing the preparation process, better

	education of staff and donors, careful stock management and other
	appropriate measures.
Numerator	Total number of non-conforming blood components, regardless of the non-
	conformity type (positive lab tests, inadequate quality, outdating, etc.).
Denominator	Total number of blood components produced including primary and modified
	components (filtered, washed, volume reduced, etc.), conforming and non-
	conforming.
Quality indicator	Poor welds in blood component preparation
Description	The percentage of blood components discarded due to poor welds relative to the total number of blood components produced.
Importance	This indicator largely points to the process ability to meet the requirements of
	monitoring enables timely service or repair/repewal of the sterile welding
	devices or of sterile connection devices or indicates inappropriate quality
	handling, or maintenance of these devices
Numerator	Total number of non-conforming blood components due to the poor weld in
	blood component preparation.
Denominator	Total number of blood components produced including primary and modified
	blood components (filtered, washed, volume reduced, etc.), conforming and
	non-conforming.
Quality indicator	Hemolysis in whole blood
Description	Percentage of collected whole blood with hemolysis.
Importance	Abnormal hemolysis of RBCs may occur during blood collection, transportation
	and processing. It may also be caused by bacterial contamination, antibodies
	and other factors related to blood donors. Hemolysis in blood unit can be
	observed by visual inspection of supernatant plasma after whole blood
Numerator	Number of collected whole blood with hemolytic aspect of plasma (complete
Numerator	collections).
Denominator	Total number of collected whole blood (complete collections).
DONOR/BLOOD CO	MPONENT TESTING
Quality indicator	Donor sample nonconformities
Definition	Percentage of non-conforming donor samples.
Importance	Reliable and accurate results of laboratory testing are a precondition for safe
	transfusion treatment. Automation of laboratory testing and continuous
	upgrading of the test quality has resulted in high analytical process
	dependability, so errors generally occur in preanalytical and postanalytical
	phase of laboratory testing. Accordingly, the quality of donor samples and the
	accuracy of their labeling should be strictly controlled, each non-conformity
	reported, and unacceptable samples excluded from testing.
Numerator	Non-conforming blood donor samples (unacceptable due to lipemia, hemolysis,
	dilution, inadequate/erroneous labeling etc.).
Denominator	Total number of donor samples.
Quality indicator	Internal quality control (IQC) failures in laboratory testing
Definition	Quality indicator of the analytical phase of the laboratory process, monitoring
	the frequency of IQC results that are outside defined acceptance criteria.
Importance	IQC is an activity that monitors and evaluates the analytical process, detects
	errors, and ensures the reliability and accuracy of test results. A poor approach
	to IQC can result in validation of incorrect results or excessive investigations of
	falsely rejected test runs. Monitoring IQC failures and identifying their causes

	(reagents, hardware, software) are important for timely implementation of
	appropriate corrective actions.
Numerator	Number of internal QC results outside defined limits.
Denominator	Total number of internal QC results.
Quality indicator	Proficiency testing
Definition	Percentage of correct results in proficiency testing.
Importance	Proficiency testing is important for continuous surveillance of laboratory testing
	performance, identification of weak points in processes and implementation of
	corrective actions with the final goal of improving quality and safety of
	transfusion.
Numerator	Correct results obtained in proficiency testing.
Denominator	Total numbers of tests performed in proficiency testing.
Quality indicator	Positive results of bacterial screening of PLT concentrates
Definition	Incidence of bacterial contamination of PLT concentrates.
Importance	Despite significant advances in the microbiological safety of blood components,
	bacterial contamination remains a threat to transfused patients and is the most
	common infectious risk of blood transfusion. The incidence of bacterial
	contamination of blood components is an indicator of the process ability to
	meet the requirements of microbiological safety of blood components.
Numerator	PLT concentrates confirmed to be positive on bacterial screening.
Denominator	Total number of platelet components subjected to bacterial screening.
Quality indicator	Non-conformities in blood component quality control results
Definition	Percentage of non-conforming quality control results relative to the total number of analyses/measurements performed.
Importance	The overall results of statistical process control are presented here with one
	single indicator. Although a deficiency in one product or parameter can be
	masked by a good overall value, monitoring this indicator is a simple way to
	assess the overall quality of blood components and trends in quality over time.
Numerator	The number of QC results (for example: PLT content, residual WBCs, hemoglobin
	content, volume, etc.), which do not comply with specified requirements.
Denominator	Total number of blood component QC results.
BLOOD COMPONEN	IT STORAGE/DISTRIBUTION/ISSUE
Quality indicator	Expired PLT concentrates
Description	Percentage of PLT concentrates discarded due to expiry.
Importance	This indicator is important in assessing the effectiveness of measures
	implemented for platelet stock management, including planning of collection
	and production, cooperation with clinicians in assessing the need for transfusion
	treatment, etc. This indicator should be interpreted together with indicators
Numerator	that assess the fulfillment of requests for PLT concentrates.
Numerator	expired PLT concentrates (pools + apheresis components). PLT concentrates
Donominator	Total number of platelet components (pools + apparesis) produced
	Expired RBC concentrates
Description	Percentage of BBC concentrates discarded due to expiry
Importance	This indicator is important in assessing the effectiveness of measures
importance	implemented for RBC stock management including planning of collection and
	production cooperation with clinicians in assessing the need for transfusion
	treatment, etc. This indicator should be interpreted together with indicators
	that assess the fulfillment of orders for RBC concentrates.
Numerator	Expired RBC units (excluding units expired for the purpose of QC testing).
Donominator	Total number of RBC units produced

Quality indicator	Realization of requests for blood components
Description	Percentage of blood components distributed/issued in relation to the blood
Importance	This indicator accesses the degree to which a blood establishment meets the
importance	requirements for blood components set by customers
Numerator	Number of blood components requested
Denominator	Number of blood components distributed/issued
Quality indicator	Wrong blood component issue
	Percentage of wrong blood components issued
Importance	This indicator may point to a deficiency in the blood component issuing
importance	recodure. According to many studies, transfusion reactions are often caused
	by errors in blood component issuing. For this reason, this indicator is important
	in assessing the safety of transfusion practice
Numerator	Number of wrong blood components distributed/issued (wrong blood group or
Humerator	wrong blood component type).
Denominator	Total number of blood components distributed/issued.
Quality indicator	Returned blood components
Definition	Percentage of blood components returned for confirmed or suspected non-
	conformity, relative to the total number of blood components
	distributed/issued from the blood establishments.
Importance	This indicator refers to problems with the quality of blood components
	delivered to hospitals (or hospital blood banks). The blood components
	returned within the frame of regular stock rotation are not included in the
	calculation of this indicator. The pattern of this indicator is greatly influenced by
	the number of complaints and of blood component withdrawal/recall.
Numerator	Blood components returned because of confirmed or suspected non-
	conformity.
Denominator	Total number of blood components distributed/issued.
Quality indicator	Damaged blood components
Definition	Percentage of damaged blood components.
Importance	Blood bags can be damaged during the preparation, handling, storage and
	transportation of blood components. A visual inspection to assess the integrity
	of the packaging is extremely important. Monitoring this indicator helps in
	detecting the causes of damage (bag quality, handling errors, inadequate
	storage, etc.) and effectively removing them.
Numerator	Blood components damaged during preparation, storage and handling.
Denominator	Total number of blood components produced.
Quality indicator	Component Wastage rate (RBC concentrates, PLI concentrates, fresh frozen
Definition	plasma - FFP) at the hospital
Importance	This indicator is important in associing blood ordering and utilization.
importance	Pased on the results obtained by monitoring this indicator, it is possible to
	implement adequate corrective action and preventive action (CAPA) They
	should be based on education and organizational changes aimed at responsible
	and rational use of blood components
Numerator	Number of wasted units (RBC concentrates, PLT concentrates, FFP)
Denominator	Total number of units (RBC concentrates, PLT concentrates, FFP) received from
	the blood bank.
PATIENT SERVICE	
Quality indicator	Patient sample non-conformities

Definition	Percentage of non-conforming patient samples for pretransfusion testing. Sample nonconformities refer to labeling issues (unlabeled samples, sample label errors, missing information on samples) or sample quality (wrong container, insufficient sample volume, damaged samples, incorrect sample type, hemolyzed samples, samples with anticoagulant that are clotted or have inappropriate sample to anticoagulant ratio, inadequately transported or stored samples).
Importance	Reliable and accurate results of laboratory tests are of crucial importance for the safety of transfusion treatment. Adequate labeling and sample quality, prevention of errors and continuous monitoring of all activities from collection,
	storage and transport to receipt, inspection and processing of samples are very important in achieving this goal. The data collected by monitoring this indicator is a useful tool in the education of clinical staff who administer transfusion
Numerator	therapy.
Numerator	labeling or inadequate sample quality).
Denominator	Total number of samples for pretransfusion testing.
Quality indicator	Non-conformities in the requests for pretransfusion testing
Definition	The percentage of non-conforming requests for pretransfusion testing.
Importance	Reliable and accurate results of laboratory testing are a precondition of safe
	transfusion treatment. Accuracy and completeness of data on the requests and
	matching of identification data on request form and the sample label are among
	the most important parameters to be monitored. The data collected by
	monitoring this indicator is a useful tool in the education of clinical staff who
	administer transfusion therapy.
Numerator	Non-conforming requests for pretransfusion testing (wrong or incomplete data
	resulting in rejection of the request).
Denominator	I otal number of requests for pretransfusion testing.
Quality indicator	Internal quality control (IQC) failures in laboratory testing
Definition	Quality indicator of the analytical phase of the laboratory process, monitoring the frequency of IQC results that are outside defined acceptance criteria.
Importance	IQC is an activity that monitors and evaluates the analytical process, detects errors, and ensures the reliability and accuracy of test results. A poor approach
	to IQC can result in validation of incorrect results or excessive investigations of
	(reagents, hardware, software) are important for timely implementation of
	appropriate corrective actions.
Numerator	Number of internal QC results outside defined limits.
Denominator	Total number of internal QC results.
Quality indicator	Test turnaround time (TAT) – urgent requests
Definition	Percentage of emergency laboratory tests completed within prescribed TAT (the period from receipt of the sample at the laboratory until the release of the report).
Importance	In addition to providing reliable, precise, and accurate reports, the quality of
	laboratory services is also measured by the timely delivery of test reports. This
	is especially important in emergency situations. TAT is therefore one of the key
	indicators of laboratory efficiency. By monitoring and analyzing TAT, the
	laboratory can identify factors that affect reporting time and implement
	measures to improve the quality of services.
Numerator	Total number of emergency laboratory tests completed within prescribed TAT.

Quality indicator	Crossmatch/transfusion (C/T) ratio
Definition	Crossmatch to transfusion ratio = number of units cross matched/number of units transfused.
Importance	This is an important quality indicator of blood ordering and utilization. It is used for assessment of pretransfusion test ordering appropriateness and benchmarking between departments and hospitals. Monitoring this indicator can improve the efficacy of the ordering system for cost-effective testing and minimal wastage of blood components. Note: There are also other methods available to assess efficiency of blood requesting and its utilization, as Transfusion index (TI) = number of units transfused/number of patients cross-matched) and Transfusion Probability (TP) = number of patients transfused /number of patients cross-matched x 100
Numerator	Total number of red blood cell units cross-matched.
Denominator	Total number of red blood cell units transfused.
Quality indicator	ABO/Rh(D) discrepancies
Definition	Differences between results of ABO/Rh(D) determination in two independent patient samples.
Importance	ABO/Rh(D) discrepancies may result from different causes, such as misidentification of patients, labeling errors, technical errors etc. It is a common practice in many blood establishments to perform ABO and Rh(D) testing of the patient on two independently collected samples. Such a policy is a precondition for the implementation of electronic cross-match, but also the measure for improving the safety of transfusion therapy. Monitoring this indicator is important for the assessment of blood transfusion safety and improvement through implementation of appropriate corrective actions.
Numerator	The number of ABO/Rh(D) discrepancies.
Denominator	Total number of patients whose ABO/Rh(D) blood type was determined two or more times.
Quality indicator	Incorrect laboratory reports issued
Definition	The percentage of issued laboratory reports that were found to be erroneous. The error can be discovered in the laboratory, or after a customer complaint.
Importance	Although issuing incorrect test results is a rare event, the consequences for the patient can be very serious. For this reason, maximum attention should be paid to the prevention of such events. Evaluation/validation of the results is of critical importance here. The monitoring of this indicator is important in the assessment of the overall quality and safety of the laboratory process.
Numerator	Number of incorrect reports issued by the laboratory.
Denominator	Total number of reports issued by the laboratory.
Quality indicator	RBC units issued in emergency without testing
Definition	The percentage of RBC units issued without pretransfusion testing due to emergency.
Importance	In patients who urgently require transfusion therapy, it is sometimes necessary to transfuse RBC products before the completion of routine pretransfusion testing. These are lifesaving procedures where benefits for the patient outweigh possible risks. Group O RBCs are typically issued to prevent hemolytic transfusion reaction due to ABO incompatibility. Emergency issuing of RBC units before completion of routine pretransfusion testing carries a risk of hemolytic transfusion reactions due to clinically significant alloantibodies.
Numerator	Number of RBC units issued in emergency without pretransfusion testing or before completion of all required tests, including ABO type, antibody detection

	test, antibody identification (if applicable) antigen typing of RBC unit and
	crossmatch.
Denominator	Total number of RBC units issued for transfusion therapy.
Quality indicator	Proficiency testing
Definition	Percentage of correct results in proficiency testing.
Importance	Proficiency testing is important for continuous surveillance of laboratory
	testing performance, identification of weak points in processes and
	implementation of corrective actions with the aim of improving quality and
	safety of transfusion treatment.
Numerator	Correct results obtained in proficiency testing.
Denominator	Total number of tests performed in proficiency testing.
Quality indicator	Serious adverse reactions (SAR) in patients
Description	Incidence of SAR in patients (expressed usually as % or n/1000). This indicator
	can be monitored separately for different types of blood components, for
	certain types of reactions or different groups of patients.
Importance	Transfusion treatment is a safe procedure, and transfusion reactions, especially
	serious ones, are very rare. However, some risks of transfusion treatment
	cannot be predicted, and some of the known risks cannot always be successfully
	prevented. Systematic monitoring, reporting and analysis of transfusion
	reactions is important in assessing the safety of transfusion treatment and the
	success of measures implemented with the aim of increasing the safety of blood
Numerator	The number of SAB recorded in transfused nationts
Donominator	Total number of blood components transfused (or issued for transfusion)
Quality indicator	Complaints on blood components
Definition	Percentage of blood components for which complaints were received, relative
Definition	Percentage of blood components for which complaints were received, relative to the total number of blood components distributed/issued.
Definition Importance	Percentage of blood components for which complaints were received, relative to the total number of blood components distributed/issued.Continuous customer satisfaction with the quality of products and services
Definition Importance	 Percentage of blood components for which complaints were received, relative to the total number of blood components distributed/issued. Continuous customer satisfaction with the quality of products and services provided is one of the basic goals of quality management in blood
Definition Importance	 Percentage of blood components for which complaints were received, relative to the total number of blood components distributed/issued. 	highlights the importance of root cause analysis to identify appropriate
	measures in avoiding SAE recurrence. Timely reporting and analysis of SAE is
	therefore of critical importance for assessment and improvement of transfusion
	safety.
Numerator	Number of SAE.
Denominator	Total number of blood components processed.
Quality indicator	Recall/withdrawal of blood components
Definition	Percentage of blood components recalled due to confirmed or suspected non-
	conformity.
Importance	This indicator is important in assessing the risk to the safety of transfusion
	treatment arising from the distribution of blood products for which a
	quality/safety problem has subsequently been identified or suspected.
Numerator	Blood components recalled due to confirmed or suspected non-conformity.
Denominator	Total number of blood components distributed/issued.
Quality indicator	CAPA completed on time (initiated by quality department)
Definition	Percentage of corrective/preventive actions (CAPA) initiated by quality
	department, completed on time.
Importance	Continuous quality improvement is a key principle and goal of QMS.
	Achievement of this goal depends on the timely and consistent implementation
	of CAPA. They are initiated to correct and prevent recurrence of existing
	nonconformity or prevent occurrence of potential nonconformity. Monitoring
	the implementation of CAPA is a tool that evaluates the effectiveness of the
	QMS and staff commitment to continuous quality improvement.
Numerator	CAPA completed on time.
Denominator	Total number of CAPA initiated by quality department.
Quality indicator	Corrective actions from external audits/inspections completed on time
Definition	Percentage of corrective actions initiated during external audits/inspections, completed on time.
Definition Importance	Percentage of corrective actions initiated during external audits/inspections, completed on time. Continuous quality improvement is the basic goal of QMS. Achievement of this

Importance	The change control system enables timely planning, evaluation, implementation, and documentation of all changes that may affect the quality, safety and availability of blood components, as well as the safety of blood donors and patients. The timely implementation of all required activities is important for undisturbed functioning of processes in blood establishments.
Numerator	Change controls completed on time.
Denominator	Total number of change controls initiated.
Quality indicator	Donor satisfaction / Customer satisfaction
Definition	Donor satisfaction is a measure of donor satisfaction with the service provided by a blood establishment (availability of donation sites, kindness of the staff, comfort, hygiene, etc.). Customer satisfaction is a measure of how products or services delivered meet customer needs and expectations. This quality indicator is expressed as a percentage of responses in a donor/customer satisfaction survey with acceptable scores.
Importance	Focusing on donors/customers and meeting their needs and expectations is the highest priority of the quality system. The level to which this requirement is fulfilled can be assessed in different ways. One of the most common is a questionnaire. Based on the results obtained, blood establishments should initiate appropriate CAPA in order to improve customer satisfaction.
Numerator	Number of responses with acceptable score.
Denominator	Total number of survey responses.
